

The FCC is receiving many comments concerning this technology from licensed radio amateurs with links to extensive studies carried out in countries around the world. Almost uniformly these studies have demonstrated significant interference with protected low-level high frequency transmissions. For a comprehensive set of references please see <http://www.arrl.org/tis/info/HTML/plc/>.

Under no circumstances should BPL technology be permitted without the strongest guarantees assuring the integrity of already licensed communications under realistic worst-case conditions. The FCC bears the responsibility of protecting existing licensees, and current users of the radio spectrum require that you exercise your authority appropriately before licensing such a potentially harmful broadband emission source.

Thank you.

John Wiesenfeld/W5NYC
